

Help strengthen your security posture and address identity-driven risk—without adding IT complexity

Managed Identity and Access Management (IAM) with Accenture

Help secure access and control over user identities across your business—designed for scale, speed and confidence.

Verizon's Managed IAM with Accenture helps simplify access and strengthen security by centralizing control over enterprise applications, identities and high-risk accounts. The modular platform supports organizations of all sizes with policy-based governance, automation and scalable protection, while reducing the need for extra IT resources.

IAM threats don't necessarily stop at stolen credentials. Nearly 60% of cybersecurity incidents begin with identity issues, but many stem from admin misuse, shared logins or lack of authority to act when threats emerge.¹ The solution can address the full spectrum of identity risk with Zero Trust enforcement, access automation and near real-time controls to help reduce breakout times and policy drift across hybrid environments.

The service suite includes:

- **Identity Governance and Administration (IGA)** – for provisioning, access requests and scalable governance
- **Access Management (AM)** – for single sign-on and multifactor access
- **Privileged Access Management (PAM)** – for enforcing least privilege and just-in-time access across sensitive systems

All supported by a unified control layer for visibility and compliance.

With Verizon and Accenture, you don't have to manage fragmented tools. We help you consolidate identity functions into a single, managed experience, giving security teams more time to focus on outcomes, not integration.

Backed by Fortune 100 experience, this solution addresses some of today's most common breach vectors—starting with identity—so your business can scale securely and confidently.

What you get	How it helps
Operational control	Automate policies and monitor access across distributed systems—prevent misconfigurations and shared credential risks.
Faster outcomes	Prebuilt workflows and automations speed onboarding and time-to-impact.
Compliance	Enforce least privilege, conduct audits and reduce manual effort for evolving regulatory needs.
Risk mitigation	Address insider misuse and access drift—whether from stolen, shared, orphaned or misused credentials.
Modular flexibility	Expand capabilities as your business evolves, while integrating with existing infrastructure.

Why Verizon

For over two decades, Verizon has helped enterprises and organizations mature their security programs—focusing not only on detection and response, but the foundational identity challenges that expose them to risk in the first place.

Together, Verizon and Accenture bring:

- Global reach + deep IAM expertise
- End-to-end support across strategy, implementation and operations
- Flexible, scalable solutions designed to meet your current maturity and accelerate outcomes

Whether you're consolidating legacy tools, reducing complexity or scaling secure access across business units, our teams meet you where you are—and help you move your security program forward.
